EasyShare INIT Demo EasyShare Demo EasyShare Demo Doc (this file)

Description

EasyShare is an AppleShare compatible file server that gives Macintosh users a quick and easy way to share files on an AppleTalk network. Its main features include:

- AppleShare compatibility

AppleShare compatibility means that EasyShare works with Apple's AppleShare software. You can mix computers running EasyShare along with AppleShare file servers on the same network.

- Runs in background

Running in background means that you don't have to dedicate a computer to be your server. This keeps the cost down. Every computer running EasyShare can be a server, and you can continue to use the computer while others use files on its disk.

- Easy control of the files you want to share

With EasyShare you are in control of the data you want others to use. You may allow others access to an entire volume or just selected folders within the volume. You don't have to set up complex user lists, group lists or access rights for each and every folder like other server software. You simply select a folder (or the entire volume) and publish it for others to use.

In addition to this, you may also -

- assign passwords to each volume or folder
- automatically publish a volume or folder whenever you turn on your computer
- allow others to use a file, but not change its contents

- Minimal installation

You need only to install EasyShare on the computers that have the files to be shared. All the other computers that want to use these files simply use Apple's built-in AppleShare software that comes on Apple's System disks.

Differences in the demo version

The demo version of the EasyShare software works exactly like the real version except for the following differences -

- only 1 volume or folder may be published at a time (the real version allows 10)
- only 1 user may access EasyShare at a time (the real version allows 10)
- automatic publishing of a volume or folder is disabled
- you may only use a published volume or folder for up to 10 minutes

(it is removed from the desktop after that time)

- the *EasyShare* program is an application (in the real version it is a desk accessory)

Installation

- 1) Drag the *EasyShare INIT Demo* file to the *System Folder* of your startup disk.
- 2) Make sure that the *EasyShare Demo* application is also on your disk.
- 3) Make sure you have entered a name for your computer in the Chooser desk accessory User Name box. EasyShare will use this name as the name of the server. Also, make sure that AppleTalk is active.
- 4) Restart your computer to activate *EasyShare INIT Demo*. As your computer restarts, the EasyShare icon appears at the bottom of your screen while the Welcome to Macintosh message is displayed. This indicates that the *EasyShare INIT Demo* is working properly.

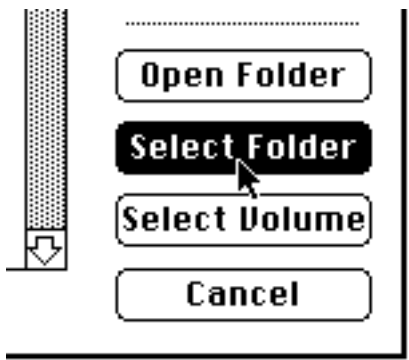

Publishing a folder for others on the network to use

- 1) Run the *EasyShare Demo* program.
- 2) Add a new folder to the list of sharable volumes and folders by clicking on the **New ...** button.

- 3) A standard file dialog box appears. Click on a folder name, and then click on the **Select Folder** button. (You may publish an entire disk by clicking on the **Select Volume** button.)

- 4) Publish that folder by clicking on the **Publish** Button.

Using the published folder from another computer

You must use Apple's AppleShare software from another computer on your network to access the folder you published. You may need to install Apple's AppleShare software from your *System* disks.

1) Open the **Chooser** desk accessory from the Apple (🍏) menu and click on the AppleShare icon. If the icon is not present, you must install Apple's AppleShare software from your *System* disks. The name of the computer that you published the folder on should appear in the **Select a file server** list.

2) Click on the name of the computer you published the folder on and then click on the **OK** button.

3) Next, a login dialog box will appear asking for your user name and password. Just click on the **OK** button.

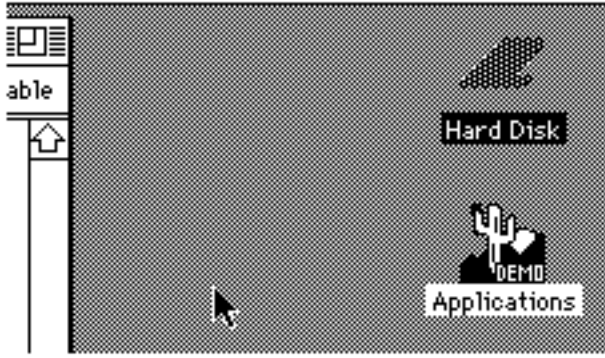

4) Next, a list of the folders you published on the other computer appears. Click on the name of the folder you published. Click on the **OK** button.

Select the server volumes you want to use:

5) Finally, the *EasyShare* icon will appear on the desktop. The folder you published on the other computer works as if it were a disk on your local computer.

Technical information

Maximum values (for the real version)

Depending on the System version, amount of free memory, other applications/INITs/ DA's that are running, and AppleTalk activity, these numbers may be smaller.

# of users sharing a disk at one time	10
# of files each user can have open at a time	10
# of published volumes/folders	10
# of volumes/folders in the Sharable Volumes & Folders list	20

Macintosh System versions supported

Any Apple supported system from System 3.2, Finder 5.1 to the present.

Memory usage

EasyShare INIT	approximately 53 K bytes
EasyShare desk accessory (when opened)	approximately 32 K bytes

Ordering information

The suggested retail price for EasyShare is \$149.95. This includes fully functional versions of EasyShare INIT, the EasyShare desk accessory, and a 50 page manual.

For a limited time, we are offering EasyShare for a special introductory price of \$99.95.
